

ELEMENTARY PARTICLE THEORY

A. D. MARTIN

*Department of Physics,
University of Durham*

T. D. SPEARMAN

*School of Mathematics,
Trinity College, Dublin*

1970

NORTH-HOLLAND PUBLISHING COMPANY-AMSTERDAM

CONTENTS

CHAPTER 1. THE ELEMENTARY PARTICLES AND THEIR INTERACTIONS	1
1. General Introduction	1
2. Symmetries and Conservation Laws	14
3. Theoretical Approach to Elementary Particle Interactions	22
3.1. <i>Electromagnetic Interactions</i>	23
3.2. <i>Weak Interaction Processes</i>	28
3.3. <i>Strong Interactions</i>	36
CHAPTER 2. QUANTUM MECHANICS AND INVARIANCE PRINCIPLES	45
1. Résumé of Quantum Mechanics	45
2. The S-matrix	62
3. Invariance Principles and Conservation Laws	65
3.1. <i>Groups of Symmetry Transformations and their Representations in Hilbert Space</i>	66
3.2. <i>The Relevance of the Group Structure of Symmetry Transformations</i>	71
3.3. <i>Invariance under a Lie Group of Transformations</i>	74
3.4. <i>Finite Symmetry Groups</i>	90
4. Super-selection Rules	94
Problems	97
CHAPTER 3. INVARIANCE UNDER THE INHOMOGENEOUS LORENTZ GROUP	101
1. Introduction	101
1.1. <i>Lorentz Transformations</i>	102
1.2. <i>Invariance under Lorentz Transformations</i>	104

2. Representations of the Restricted Inhomogeneous Lorentz Group	106
2.1. <i>Momentum Space</i>	108
2.2. <i>The Little Hilbert Space</i>	111
2.3. <i>The 3-dimensional Rotation Group</i>	113
2.4. <i>Definition of the Scalar Product</i>	115
3. Irreducible Representations of the RIHL and their Physical Interpretation	117
3.1. <i>Spin Direction and Helicity States</i>	119
4. Two-particle Helicity States	121
4.1. <i>Normalization</i>	126
4.2. <i>Irreducible Representations of the RIHL defined on Two-particle State Vectors</i>	130
5. Two-particle States in the <i>LS</i> -coupling Scheme	131
Problems	133
 CHAPTER 4. THE <i>S</i> -MATRIX AND THE KINEMATICS OF SCATTERING	 135
1. Scattering Amplitudes – The <i>S</i> -matrix and the <i>T</i> -matrix	136
2. Transition Probabilities and Cross-sections	140
2.1. <i>Transition Probabilities</i>	140
2.2. <i>Box-normalization</i>	147
2.3. <i>Cross-sections</i>	150
2.4. <i>Covariance of the Cross-section</i>	153
2.5. <i>Phase-space</i>	156
3. Kinematics	164
3.1. <i>The c.m. and lab. Frames of Reference</i>	166
3.2. <i>Related Processes and ‘Channels’</i>	171
4. Partial Wave Amplitudes	177
5. Unitarity	181
5.1. <i>The Unitarity Condition for Partial Wave Amplitudes</i>	186
5.2. <i>Scattering of Spin-zero Particles – Phase-shifts</i>	188
6. Elastic and Inelastic Cross-sections	191
7. Polarization Phenomena	194
7.1. <i>Multipole Parameters</i>	195
7.2. <i>Polarization Formulae for Scattering Processes</i>	198
7.3. <i>Polarization Analysis of Particle Decays</i>	203
Problems	208

CHAPTER 5. OTHER SYMMETRY PRINCIPLES	213
1. Space and Time Inversion	214
1.1. <i>The Space Inversion Operator P</i>	217
1.2. <i>The Time Inversion Operator T</i>	218
2. Parity Invariance	219
2.1. <i>Intrinsic Parities</i>	220
2.2. <i>Space Inversion Properties of One-particle Helicity States</i>	222
2.3. <i>Space Inversion Properties of Two-particle States</i>	223
2.4. <i>Scattering Amplitudes and Parity Invariance</i>	226
3. Time-reversal Invariance	227
3.1. <i>Time-reversal Properties of One-particle Helicity States</i>	228
3.2. <i>Time-reversal Properties of Two-particle Helicity States</i>	229
3.3. <i>S-matrix Elements and Time-reversal</i>	230
4. Identical Particles	232
5. Particle-Antiparticle Conjugation	234
5.1. <i>Eigenstates of C</i>	236
5.2. <i>Extended Particle-Antiparticle Conjugation – G Parity</i>	239
5.3. <i>The TCP Theorem</i>	242
6. Applications of the Symmetry Principles	242
6.1. <i>Counting the Number of Independent Amplitudes</i>	243
6.2. <i>Selection Rules</i>	244
6.3. <i>Partial Wave Analysis of Spin 0–Spin $\frac{1}{2}$ Scattering</i>	246
6.4. <i>Partial Waves for Spin $\frac{1}{2}$–Spin $\frac{1}{2}$ Scattering</i>	252
7. Further Isospin Considerations	255
7.1. <i>Antiparticle Isospin States and Crossing</i>	256
7.2. <i>Isospin Crossing Matrices</i>	258
7.3. <i>Isospin Properties of Vertices</i>	266
7.4. <i>Phase Conventions</i>	267
Problems	270
 CHAPTER 6. ANALYTIC PROPERTIES OF SCATTERING AMPLITUDES	 273
1. Single Variable Dispersion Relations	280
1.1. <i>The Pole Term</i>	284
1.2. <i>Subtractions in Dispersion Relations</i>	288

1.3. <i>Dispersion Relations for Forward Scattering</i>	293
2. Double Variable Dispersion Relations – The Mandelstam Representation	299
2.1. <i>Double Spectral Representation for the Complete Amplitude</i>	308
2.2. <i>Subtractions in the Mandelstam Representation</i>	311
2.3. <i>The Mandelstam Representation for Pion-Nucleon Scattering</i>	313
Problems	316
CHAPTER 7. CROSSING AND ANALYTICITY PROPERTIES OF HELICITY AMPLITUDES	
1. Lorentz Transformations	319
1.1. <i>Single-particle Helicity States</i>	320
1.2. <i>Transformation Law for Helicity Amplitudes</i>	321
2. Crossing Relations for Helicity Amplitudes	325
2.1. <i>Crossing</i>	328
2.2. <i>Crossing Relation for c.m. amplitudes</i>	328
2.3. <i>Examples of Crossing Relations</i>	334
3. Kinematic Singularities and Constraints	341
3.1. <i>Threshold and Pseudthreshold – General Mass Case</i>	344
3.2. <i>Threshold and Pseudthreshold – Elastic Scattering</i>	347
3.3. <i>Kinematic Singularities and Constraints at $s = 0$</i>	353
3.4. <i>Singularities at the Physical Region Boundary</i>	357
3.5. <i>Construction of Kinematic Singularity-free Amplitudes</i>	359
3.6. <i>Kinematic Singularities and Crossing</i>	360
Problems	365
CHAPTER 8. PARTIAL WAVE AMPLITUDES	
1. Analytic Properties of Partial Wave Amplitudes	366
1.1. <i>Unequal Mass Particles</i>	371
1.2. <i>Extension to Particles with Non-zero Spin</i>	376
2. Asymptotic Bounds on Scattering Amplitudes	382
3. Unitarity and Partial Wave Amplitudes	383
3.1. <i>Resonances</i>	388
3.2. <i>The N/D Method</i>	389
3.3. <i>The Bootstrap Hypothesis</i>	399
Problems	406

CHAPTER 9. REGGE POLES	413
1. Complex Angular Momentum – Spin Zero Scattering	415
1.1. <i>The Sommerfeld-Watson Transform</i>	415
1.2. <i>Relation between Regge Poles and Resonances or Bound States</i>	425
1.3. <i>Properties of the Regge-pole Functions $\alpha(s)$ and $\beta(s)$</i>	428
1.4. <i>Predictions for high energy scattering</i>	429
2. Regge Poles – Scattering of Particles with Spin	434
2.1. <i>The Generalized Froissart-Gribov Projection</i>	435
2.2. <i>Parity-conserving Amplitudes</i>	438
2.3. <i>The Sommerfeld-Watson Transform of Helicity Amplitudes</i>	441
2.4. <i>Behaviour of Regge Pole Residues</i>	445
2.5. <i>Predictions for high energy scattering</i>	449
2.6. <i>Example: $\pi^- p \rightarrow \pi^0 n$ and ρ Regge pole exchange</i>	450
3. Superconvergence Relations and Finite-energy Sum Rules	458
3.1. <i>Example: Application of FESR to πN Charge Exchange</i>	462
3.2. <i>Duality?</i>	466
Problems	474
APPENDIX A. The Three-dimensional Rotation Group	477
1. Clebsch-Gordan Coefficients	479
2. Rotation Matrices	483
3. Spherical Harmonics	486
4. Irreducible Tensor Operators	488
APPENDIX B. Unitary and Antiunitary Transformations	489
APPENDIX C. Generators of the Lorentz Group	493
APPENDIX D. The Dirac δ -function	496
Comments and hints for the problems	499
References	517
Subject index	521
