Springer-Verlag
Berlin Heidelberg New York Tokyo 1984

Contents

1. Various Aspects of Memory 1
1.1 On the Purpose and Nature of Biological Memory 1
1.1.1 Some Fundamental Concepts 1
1.1.2 The Classical Laws of Association 3
1.1.3 On Different Levels of Modelling 4
1.2 Questions Concerning the Fundamental Mechanisms of Memory 4
1.2.1 Where Do the Signals Relating to Memory Act Upon? ... 5
1.2.2 What Kind of Encoding is Used for Neural Signals? 6
1.2.3 What are the Variable Memory Elements? 7
1.2.4 How are Neural Signals Addressed in Memory? 8
1.3 Elementary Operations Implemented by Associative Memory .. 14
1.3.1 Associative Recall 14
1.3.2 Production of Sequences from the Associative Memory .. 16
1.3.3 On the Meaning of Background and Context 20
1.4 More Abstract Aspects of Memory 21
1.4.1 The Problem of Infinite-State Memory 21
1.4.2 Invariant Representations 22
1.4.3 Symbolic Representations 24
1.4.4 Virtual Images 25
1.4.5 The Logic of Stored Knowledge 27

2. Pattern Mathematics 30
2.1 Mathematical Notations and Methods 30
2.1.1 Vector Space Concepts 30
2.1.2 Matrix Notations 41
2.1.3 Further Properties of Matrices 44
2.1.4 Matrix Equations 48
2.1.5 Projection Operators 54
2.1.6 On Matrix Differential Calculus 57
2.2 Distance Measures for Patterns 59

2.2.1 Measures of Similarity and Distance in Vector Spaces 59
2.2.2 Measures of Similarity and Distance Between Symbol Strings 63

3. Classical Learning Systems 67
3.1 The Adaptive Linear Element (Adaline) 68
3.1.1 Description of Adaptation by the Stochastic Approximation 70
3.2 The Perceptron 71
3.3 The Learning Matrix 73
3.4 Physical Realization of Adaptive Weights 76
3.4.1 Perceptron and Adaline 76
3.4.2 Classical Conditioning 77
3.4.3 Conjunction Learning Switches 79
3.4.4 Digital Representation of Adaptive Circuits 79
3.4.5 Biological Components 80
3.5 Holographic Memories 80
3.5.1 A Simple Principle of Holographic Associative Memory . 82
3.5.2 Addressing in Holographic Memories 84

4. A New Approach to Adaptive Filters 90
4.1 Survey of Some Necessary Functions 90
4.2 On Physical and Biological Modelling 92
4.3 Models for Basic Adaptive Units 95
4.3.1 Formulation of the Transfer Function 95
4.3.2 Various Cases of Adaptation Laws 97
4.3.3 Two Limit Theorems 104
4.3.4 The Novelty Detector 106
4.4 Adaptive Feedback Networks 110
4.4.1 The Autocorrelation Matrix Memory 111
4.4.2 The Novelty Filter 115

5. Self-Organizing Feature Maps 125
5.1 On the Feature Maps of the Brain 125
5.2 Formation of Localized Responses by Lateral Feedback 128
5.3 Computational Simplification of the Process 133
5.3.1 Definition of the Topology-Preserving Mapping 133
5.3.2 A Simple Two-Dimensional Self-Organizing System 136
5.4 Demonstrations of Simple Topology-Preserving Mappings 139
5.4.1 Images of Various Distributions of Input Vectors 139
5.4.2 "The Magic TV" 143

5.4.3 Mapping by a Feeler Mechanism 145
5.5 Tonotopic Map 146
5.6 Formation of Hierarchical Representations 147
5.6.1 Taxonomy Example 147
5.6.2 Phoneme Map 148
5.7 Mathematical Treatment of Self-Organization 149
5.7.1 Ordering of Weights 150
5.7.2 Convergence Phase 156
5.7.3 The Magnification Factor 159
5.8 Automatic Selection of Feature Dimensions 160

6. Optimal Associative Mappings 162
6.1 Transfer Function of an Associative Network 163
6.2 Autoassociative Recall as an Orthogonal Projection 164
6.2.1 Orthogonal Projections 164
6.2.2 Error-Correcting Properties of Projections 165
6.3 The Novelty Filter 167
6.3.1 Two Examples of Novelty Filter 167
6.3.2 Novelty Filter as an Autoassociative Memory 169
6.4 Autoassociative Encoding 169
6.4.1 An Example of Autoassociative Encoding 170
6.5 Optimal Associative Mappings 171
6.5.1 The Optimal Linear Associative Mapping 172
6.5.2 Optimal Nonlinear Associative Mappings 176
6.6 Relationship Between Associative Mapping, Linear Regression, and Linear Estimation 179
6.6.1 Relationship of the Associative Mapping to Linear Regression 179
6.6.2 Relationship of the Regression Solution to the Linear Estimator 180
6.7 Recursive Computation of the Optimal Associative Mapping ... 181
6.7.1 Linear Corrective Algorithms 182
6.7.2 Best Exact Solution (Gradient Projection) 183
6.7.3 Best Approximate Solution (Regression) 184
6.7.4 Recursive Solution in the General Case 186
6.8 Special Cases 187
6.8.1 The Correlation Matrix Memory 187
6.8.2 Relationship Between Conditional Averages and Optimal Estimator 188

7. Pattern Recognition 189
7.1 Discriminant Functions 189

7.2 Statistical Formulation of Pattern Classification 191
7.3 Comparison Methods 194
7.4 The Subspace Methods of Classification 196
7.4.1 The Basic Subspace Method 196
7.4.2 The Learning Subspace Method (LSM) 197
7.5 Feature Extraction 203
7.6 Clustering 203
7.6.1 Simple Clustering (Optimization Approach) 204
7.6.2 Hierarchical Clustering (Taxonomy Approach) 205
7.7 Structural Pattern Recognition Methods 206

8. More About Biological Memory 210
8.1 Physiological Foundations of Memory 210
8.1.1 On the Mechanisms of Memory in Biological Systems ... 210
8.1.2 Structural Features of Some Neural Networks 213
8.1.3 Functional Features of Neurons 218
8.1.4 Modelling of the Synaptic Plasticity 222
8.1.5 Can the Memory Capacity Ensue from Synaptic Changes? 227
8.2 The Unified Cortical Memory Model 230
8.2.1 The Laminar Network Organization 230
8.2.2 On the Roles of Interneurons 232
8.2.3 Representation of Knowledge Over Memory Fields 233
8.2.4 Self-Controlled Operation of Memory 237
8.2.5 A Note on the "Connectionistic" View 238
8.3 Collateral Reading 239
8.3.1 Physiological Results Relevant to Modelling 239
8.3.2 Related Modelling 240

Bibliography on Pattern Recognition 241
