Preface to the fourth edition

xiii

Section I Perspective

1 The production function within the corporation **3**

Introduction – production engineering? – production management: a conceptual framework – production management and corporate policy – the production management function – manufacturing policy – scope of the present text

2 Planning and control **15**

The system within a system – objectives and policies – planning forecasts – the budget – the control function: the thermostatically-controlled room; essential features of control; necessary conditions for control – industrial control systems: satisfactory operation of industrial control; advantages of explicit control

3 Budgets and budgetary control **30**

Preparing the budget – the capital expense budget – the break-even chart – the margin of safety – drawing a break-even chart – budgetary control – the profit graph and the profit/volume ratio – preparation of budgetary control statements – example of a budgetary control statement – value added

Section II The PRODUCT

4 Control of variety **45**

Variety control a managerial responsibility – a variety control programme – benefits of variety control: in marketing; in design; in production – variety control in the final product – variety control in the components used – variety control in purchased items – variety control in production

5 Control of value	55
The identification of function – value – carrying out a value analysis exercise – value engineering	
6 Quality of the product	62
The importance and meaning of quality and reliability – the achievement of quality – the cost of quality – the cause-effect (Ishikawa) diagram – quality circles: social aspects; technical aspects; managerial aspects – accuracy and precision – reliability – measures of reliability – system reliability	
7 Design of the product	80
Definition of design – responsibility for design – five stages of a design project: conception; acceptance; execution; translation; pre-production – the control of a design product – the use of CPA in design – project cost control – reducing design costs: buying design effort; use of a computer; specialization by designers; use of a logical coding system; use of a library and technical information service – the drawing office – change system	
<i>Section III The PLANT</i>	
8 Location of the plant	101
Choice – selection – use of linear programming	
9 Design of the plant	107
Factors affecting the design of the plant – office accommodation – advantages of a single-storey building – advantages of multi-storey building	
10 Layout of the plant	115
Meaning of layout – product and process layout – criteria for a good layout – advantages of a good layout – preparing a layout – installation of a layout – the use of the computer in preparing a layout	
11 Equipping the plant	127
Equipment survey – use – cost – economic appraisal of plant – the payback period – return on investment – discounted cash flow – the internal rate of return – appraisal rather than costing – the loss of value of plant – the life of plant	
12 Maintenance of the plant	142
The maintenance department – duties – rules governing – types	

of activity – maintenance policies – need for data – maintenance costs – types of maintenance policy – repair and replacement – the repair limit – replacement due to failure – replacement due to deterioration

Section IV The PROCESSES

- 13 Types of production I: job, batch, flow** **157**
 Job production – batch production – flow production – batch production and functional layout – line balancing in flow production – continuous production – jobbing – mass production
- 14 Types of production II: Group Technology** **169**
 Valueless costs – the technical approach – the social approach – the managerial approach – characteristics of a group or cell – families of parts – coding systems – production flow analysis – choice of family – summary of benefits usually claimed for group technology – application of GT to non-machining activities
- 15 Work Study I: Method Study** **178**
 Method study – select – record – analyze and develop – define and install – maintain
- 16 Work Study II: Work Measurement** **189**
 The Standard Time – use of time standards – methods of work measurement: time study; synthesis and analytical estimating; predetermined motion time systems (PMTS) – activity sampling – control of indirect labour – organization and methods
- 17 The workplace** **205**
 Man and his dimensions – at the workplace – at the machine – information – display and controls – the working environment
- 18 Materials handling** **216**
 Costs – aids to good materials handling – manpower – gravity – power – packaged loads – motor transport
- 19 Estimating and planning** **225**
 Estimating – types of estimate – estimating for design – estimating for manufacture – accuracy of estimates – organization and location of an estimating department – planning – the works order – the operation layout – the route – production aids

20 Control of quality	236
Conformance quality – inspection – inspection criteria – responsibilities of the inspection department – the location of the quality control department – statistical quality control – assignable causes – random variations – control by variables – sampling – control charts: mean and range; setting-up and using – control by attributes – acceptance sampling plans – operating characteristics – inspection records – statistical quality control, use and advantages – installation of SQC – quality index	
21 Costing	262
Sources of information – labour – material – overhead records – location of costs – recovery of overheads – absorption and marginal costing – standard costing	
<i>Section V The PROGRAMMES</i>	
22 Production Control I: general	277
Marketing policy and production control – outline of functions – parameters affecting production control – sequence of operations – the computer	
23 Production Control II: scheduling and loading	286
Scheduling and loading – the load – capacity – the problem of scheduling – scheduling rules – some special methods	
24 Production Control III: an example	298
An example of schedule preparation in a batch production unit – stock orders – customers' orders	
25 Production Control IV: line of balance	313
Where Line of Balance can be used – LoB in use – CPA and LoB	
26 Production Control V: dispatch and progress	323
Dispatch – progress – fundamental problems of progress – the use of the computer – presentation of information	
27 Production Control VI: material control	335
The task of the material control department – forecasting usage – lead time – methods of generating purchase or manufacturing orders – stock point generation – MRP-documentation – material control documents – material requirements planning – a material reduction programme – material specification and numbers	

28 Purchasing	358
Responsibility for purchasing – centralization and localization of purchasing – duties of a purchasing department – vendor rating – late deliveries – the purchase order – futures	
29 Storekeeping	367
Goods inwards – storekeeping – stores records – stock-taking – layout and location of stores	
 <i>Section VI The PEOPLE</i> 	
30 Personnel administration	381
Personnel policy – employment – education, training and management development – industrial relations – health and safety – welfare – wages – job evaluation – merit rating	
31 Incentive schemes	393
Non-financial incentives – financial incentives – installation of a financial incentive scheme – safeguards – characteristics of apparently effective incentive schemes – types of scheme – group bonus schemes – supervisory bonus schemes – profit sharing and co-partnership schemes – advantages of a wage incentive scheme: as a yardstick; as an aid to control – productivity agreements	
32 Health and safety at work	408
The avoidance of industrial accidents and fires – industrial accidents: the effects of an accident; types of accident – responsibility for safety – fire – the Health and Safety at Work Act 1974 – the reduction of accidents – fire: incidence of; fire prevention and control	
 Appendices	
1 Elements of quality costs	421
2 A-B-C analysis	424
3 Activity sampling – number of observations required	432
4 Critical path analysis	434
5 Derivation of an exponentially weighted moving average	452
6 Linear programming	454
7 The learning curve	464
8 Derivation of a sales forecast and subsequent budget	467
9 Representative examination questions	483
 <i>Index</i>	 549
