

UNDERSTANDING GENETICS

Fourth Edition

NORMAN V. ROTHWELL

Long Island University, The Brooklyn Center

New York Oxford
OXFORD UNIVERSITY PRESS
1988

CONTENTS

1 FOUNDATIONS OF GENETICS	3
Achievements before 1900	3
Mendel and the choice of a genetic tool	6
Mendel's monohybrid crosses	7
Mendel's law of segregation	9
Blending inheritance disproved	11
Dominance is not always absolute	13
Misconceptions to be avoided	14
Interpretations of crosses and ratios	15
The testcross and its value	17
Dihybrid testcrosses and independent assortment	17
Independent assortment and the F_2 dihybrid ratio	19
Separate chromosomes and independent assortment	19
Recognition of the significance of Mendelian principles	23
 2 CHROMOSOMES AND THE DISTRIBUTION OF THE GENETIC MATERIAL	 26
All cells must solve certain problems	26
General features of the prokaryotic cell	27
Communication between nucleus and cytoplasm	28
Distribution of the genetic material	29
Chromosome morphology	31
Homologous chromosomes and genetic loci	32

The chromosome and the cell cycle	34
Changes at mitosis	36
The human chromosome complement	39
Giant chromosomes	45
Naming of genes and loci	46

3 CHROMOSOMES AND GAMETE FORMATION 49

Meiosis entails two nuclear divisions	49
Morphology of the early meiotic chromosome	50
Homologous chromosomes pair	51
The chromosome thread thickens	52
Homologues repel each other	52
Crossing over and the synaptonemal complex	54
End of prophase I	55
Chromosome behavior at meiosis and Mendel's laws	56
Second meiotic division effects true reduction	58
Meiosis in the male	60
Meiosis in the female	63
Meiosis in the higher plant	63
Mitosis and meiosis are common to all eukaryotes	64

4 GENIC INTERACTIONS 67

Genotype, phenotype, and characteristic	67
Interaction of two or more pairs of alleles	67
Appreciation of genic interaction and the nature of wild type	68
Genic interaction and modified ratios	71
The basis of genic interaction	73
Interrelated pathways in metabolism	76
Molecular basis of certain genetic diseases	79
Variation in gene expression	79
Basis for variation in genic expression	82
Importance of the environment in gene expression	83
Importance of both environmental and hereditary factors	85
Genes that influence survival of the individual	86
Lethals and the environment	88
Allelic forms of a gene	89
Multiple allelic series in animals, and plants	90
Antigens, antibodies, and the ABO blood grouping	93
Antigens and the Rh blood grouping	95
Antigens, grafting, and transplants	100

5 SEX AND INHERITANCE 107

Sex chromosomes	107
Genes on the X chromosome: sex linkage	108
Sex linkage in humans	111

CONTENTS

Sex linkage and the chromosome theory of inheritance	116
Sex and genic balance	119
Sex chromosome anomalies in humans	122
Sex mosaics	127
Sex chromosomes and sex determination	128
The Y chromosome and the H-Y antigen	129
Sex chromatin	131
The X chromosome and the Lyon hypothesis	132
Further evidence for the Lyon hypothesis	133
Incomplete sex linkage	135
Sex-influenced alleles	136
Sex-limited genes and the hormonal environment	138
6 PROBABILITY AND ITS APPLICATION	143
Certainty versus probability	143
Combining probabilities	144
The same combination may arise in different ways	145
Expansion of the binomial and its application	146
More than two alternatives	147
Constructing a pedigree	148
Examining a pedigree	148
Representative pedigrees	152
Pedigrees and probability	152
Chi-square and its application	154
7 CONTINUOUS VARIATION AND ITS ANALYSIS	160
Continuous versus discontinuous variation	160
Effects of inbreeding	161
Genetic versus environmental variation	162
Genes and quantitative inheritance	162
Quantitative inheritance and skin pigmentation	165
Quantitative inheritance and deep-seated characteristics	166
Estimation of allelic differences and their quantitative contribution	168
Transgressive variation	170
Importance of statistics to genetic problems	170
The mean and its calculation	172
Standard deviation and its importance	173
Variance as a measure of variability	175
Standard error of the mean and its importance	175
Intelligence and difficulties in its measurement	177
Genetic factors and behavior	179
Behavior disturbances in the human	181
Behavior as a complex phenotypic characteristic	182
Species-specific behavior	183

8 GENES ON THE SAME CHROMOSOME	187
Independent assortment versus complete linkage	187
Recombination and its calculation	193
Linkage and the F_2 generation	195
Genes linked on the X chromosome	198
Linkage groups and chromosomes	200
Chromosome mapping	200
Trihybrid crosses and mapping	204
Significance and use of a chromosome map	207
Mapping three genes on the X chromosome	209
Map length, multiple crossovers, and the amount of recombination	210
Linkage and a linear order of genes	214
 9 FURTHER ASPECTS OF LINKAGE AND CROSSING OVER	 219
Somatic cell hybridization	219
Application of linkage information in the human	223
Factors influencing crossover frequency	225
Cytological proof of crossing over	225
Neurospora as a tool in crossover analysis	227
Neurospora and tetrad analysis	230
Somatic crossing over	234
Importance of crossing over to evolution	235
 10 CHANGES IN CHROMOSOME STRUCTURE AND NUMBER	 240
Point mutations versus chromosome anomalies	240
— Inversion and its consequences	240
Inversions in <i>Drosophila</i>	242
Different types of inversion	244
Detection of deletions	247
Deletions and mapping in <i>Drosophila</i>	247
Effects of deletions in various species	249
Duplications: their origin and their effects	252
Duplication of the Bar locus and position effect	253
Heterochromatin and position effect	255
Translocation	257
Importance of translocations in the evening primrose	259
Translocations in humans	261
Chromosome aberrations and cancer	264
Chromosome alteration and evolution	265
Variation in chromosome number	267
Aneuploidy in humans	267
Aneuploidy in plant species	269
Autopolyploidy: its origin and effects	270

Allopolyploidy and plant speciation	272
Somatic cell hybridization and plant hybridization	274
Polyploidy in animals	275
Chromosome anomalies and the human	276
 11 CHEMISTRY OF THE GENE	 280
The pneumococcus transformation	280
Additional evidence for DNA as the genetic material	282
Chemistry of nucleic acids	284
Physical structure of DNA and the Watson–Crick model	289
Implications of the Watson–Crick model	291
Experimental testing of the Watson–Crick model	294
Other aspects of semiconservative replication	299
The DNA molecule and crossing over at the molecular level	304
 12 INFORMATION TRANSFER	 309
Gene control of protein synthesis	309
Transfer RNA and some of its interactions	313
Transcription and messenger RNA	315
Evidence for a triplet code	317
Codons and their assignments	322
Features of the genetic code	324
One gene—one polypeptide chain	327
Choice of DNA strand read in transcription	328
Initiation of transcription	330
Promoter regions	330
Promoters and effector molecules	333
Termination of transcription	334
Eukaryotic promoters	336
The DNA template and its messenger RNA transcript	337
 13 MOLECULAR INTERACTIONS IN TRANSCRIPTION AND TRANSLATION	 341
The ribosome and some of its interactions	341
Molecular interactions in translation	343
Initiation of translation	346
The anticodon and the wobble hypothesis	348
Ribosomal genes and the processing of ribosomes	349
Transfer RNA, its genes and its processing	354
Colinearity	354
Some differences between prokaryotes and eukaryotes	355
Fragmented genes	358
Significance of introns	360
RNA as a catalyst	361

Heterogeneous nature of eukaryotic DNA	361
Patterns of repetitive DNA in eukaryotes	363
Fingerprinting and mutant hemoglobins	365
Allelism and the functional unit at the molecular level	368

14 GENE MUTATION 377

Somatic and germinal point mutations	377
Some consequences of spontaneous mutation	379
Reversions	380
Mutation rate and some factors that influence it	382
Mismatch repair	383
Gene conversion	384
High-energy radiation and its general effects on matter	386
Radiation and mutation rate	387
Suggested mechanisms of radiation action on the genetic material	389
Interaction of radiation and other factors in the production of mutations	390
Ultraviolet and the induction of mutations	391
Chemical mutagens	393
Repair of damaged DNA	393
Effect of chemical mutagens at the molecular level	397
Bacteria and carcinogens	401

15 BACTERIAL GENETIC SYSTEMS 406

Variations in microorganisms	406
Spontaneous mutation in microorganisms and the fluctuation test	407
Replica plating technique	409
Detection of sexual recombination in bacteria	410
The fertility factor	412
Partial genetic transfer	413
High-frequency types and the transfer of genetic markers	414
Relationship among the <i>E. coli</i> mating types	416
Rolling circle method of replication	419
Rolling circle and the <i>E. coli</i> sexual system	420
Chromosome transfer and recombination	422
F factor as an episome	424
Plasmids and drug resistance	426
Plasmids and transposons	429
Transposition	432
Transformation in relationship to recombination	435

16 VIRUSES AND THEIR GENETIC SYSTEMS 440

Events following infection by phages	440
Phage lambda and temperate phages	441
Phages and transduction	444
Recombination and the genetic system of phages	447

Repeated mating in phages	450
Phage systems and the recognition of the cistron	450
Phage with single-stranded DNA	455
Overlapping genes	457
Use of viruses in the isolation of a gene	459
Cellular defenses against foreign DNA	461
Tobacco mosaic virus—an RNA virus	463
RNA viruses and the direction of flow of genetic information	464
Retrovirus replication	465
Oncogenes and tumor viruses	467
DNA tumor viruses	467

17 CONTROL MECHANISMS AND DIFFERENTIATION 474

Genetic control of enzyme induction in bacteria	474
Repressors and their interactions	478
Repression of enzyme synthesis	479
Choice between lysis and lysogeny in phage lambda	480
Transposons and gene expression	483
The unusual virus mu	485
Transposable elements in corn	486
Evidence for other mobile elements	489
Transposable elements in <i>Drosophila</i> and yeast	489
Hybrid dysgenesis	490
Proteins of chromatin	491
The chromatin fiber and the nucleosome	492
Histone proteins and gene regulation	496
Nonhistone proteins and gene regulation	497
Chromatin structure and enzyme sensitivity	497
Enhancers	498
Methylation and gene activity	498
Gene regulation and plasticity of DNA	500
Gene expression and differential processing	503
Giant chromosomes and gene activity	504
Cytoplasm and external environment in cellular differentiation	506
Control mechanisms and the cancer cell	508
Products of oncogenes	512
Differentiation in relation to time and aging	513

18 THE IMPACT OF GENETIC MANIPULATION 519

A completely artificial gene	519
Cleavage maps	520
Localization of genes in SV40	522
Mutation at preselected sites in SV40	525
Sequencing DNA	526
Genetic manipulation	529

Further applications of genetic manipulation	531
Problems in searching for the desired clone	535
Gene cloning and chromosome mapping	537
Establishing gene libraries	540
Probes and the screening of gene libraries	542
Cloning in bacteriophages	544
Searching for an oncogene	544
Gene transfer and DNA uptake	547
Gene transfer and micromanipulation	548
Viral vectors and gene transfer	550

19 APPLICATIONS OF MOLECULAR BIOLOGY 557

Molecular biology and prenatal diagnosis	557
Molecular biology and detection of persons at risk	559
Restriction enzyme polymorphisms and Huntington's disease	560
Interactions of cells of the immune system	563
Antibody diversity	563
Theories of antibody diversity	565
Recombination and the generation of antibody genes	567
Hemoglobin chains and their genes	572
Duplications and the globin genes	574
Molecular basis of globin chain disorders	576
Alpha thalassemias	578

20 NONCHROMOSOMAL GENETIC INFORMATION 583

Life cycle of Paramecium	583
Genetics of the killer trait	584
Nature of kappa and related particles	587
Extranuclear DNA in eukaryotes	590
Extranuclear machinery for information transfer	592
Petite mutations in yeast	592
Inheritance of drug resistance in yeast	595
Nonchromosomal genes in Chlamydomonas	596
Plastid autonomy in higher plants	599
Organelle genetic systems	599
Translation in organelles	602
Mitochondrial genomes of the human and yeast	605
Mitochondrial translation and the genetic dictionary	609
The chloroplast genome and its interactions	610
Biological implications of genetic information in organelles	612

21 GENES, POPULATIONS, AND EVOLUTIONARY CHANGE 617

Populations as units of evolutionary change	617
Equilibrium frequency of genes in populations	618

The Hardy–Weinberg equilibrium	620
Application of the Hardy–Weinberg law to gene frequencies in populations	621
Testing for equilibrium	621
The Hardy–Weinberg law and dominance	623
Sex-linked alleles and the Hardy–Weinberg law	625
The force of natural selection	625
Application of fitness values	626
Selection against a lethal allele	628
Selection for dominant alleles	630
The sickle cell allele and heterozygote superiority	631
Gene mutations as an evolutionary force	634
Back mutation and mutation pressure	635
Migration pressure	635
Role of chance in evolution	636
The founder effect	638
Variation in natural populations	639
Types of polymorphism	641
Consequences of the lack of population variation	641
Role of genetic isolation in speciation	643
Sympatric speciation	643
Neutral theory of evolution	645
Gene-regulation and evolution	648
 GLOSSARY	 652
ANSWERS TO REVIEW QUESTIONS	669
INDEX	695
