Introduction 1

## PART ONE PHYSICAL FOUNDATIONS 5

### ONE The planetary and geological context of life 7

Introduction 7

General background 7

Cratering 8

Faulting 11

Volcanism 14

Gradation and landforms 16

Isostatic adjustment of the crust 20

Sea-floor spreading and continental drift 21

Organic landforms 22

Conclusions 23

Further reading 24

### TWO The Earth, life, and energy cycles 25

Introduction 25

The Earth and energy cycles 25

— Cycles based on orbital changes 28

The Moon and the Earth's tides 29

Periodic extinctions of plants and animals 34

Conclusions 35

Further reading 36

## PART TWO PAST EVENTS AND THEIR BIOGEOGRAPHIC SIGNIFICANCE 39

### THREE Evolution of the biosphere 41

Introduction 41

The evolution of the Earth's atmosphere 42

CONTENTS

Evolutionary relationships between organisms 43  
Biogeochemical pathways and the evolution of the atmosphere 47  
Physical evidence of the evolution of the Earth's biosphere 52  
    Conclusions 57  
    Further reading 57

FOUR Continental drift 58

    Introduction 58  
    The development of the continental drift idea: the early hypothesis 58  
    The modern theory of sea-floor spreading and plate tectonics 59  
    Paleogeography: continental drift during the Phanerozoic 60  
    The response of animals to continental movement and geomagnetic changes 64  
        Plate tectonics and the pattern of life 67  
        The continuing effect of continental drift 73  
        Conclusions 77  
        Further reading 77

FIVE Biogeographic patterns and ice age events 78

    Introduction 78  
    Types of glaciers 78  
    Causes of extensive glaciation 79  
    Glacial climatology 80  
    Reshaping the Earth's surface 84  
    Biogeographic implications of glacial events 88  
    Conclusions 98  
    Further reading 98

PART THREE PRESENT ENVIRONMENTS AND BIOGEOGRAPHIC PATTERNS 101

SIX The climatic environment 103

    Introduction 103  
    Meteorological processes 103  
    Mountain climates and biogeography 108  
    The relationship between climate and vegetation 112  
    Dynamic aspects of climate and biogeography 118  
        Proxy data of climatic change 121  
        Causes of climatic fluctuations 122  
    Conclusions 124  
    Further reading 124

SEVEN Marine and terrestrial environments 125

    Introduction 125  
    The Earth's two major environments 125  
    Soil as a major evolutionary development 130  
    Productivity and structures of the marine environment 137

CONTENTS

Productivity and structural characteristics of terrestrial biosystems	141
Interaction of marine and terrestrial systems	146
Conclusions	147
Further reading	147
EIGHT Freshwater environments	148
Introduction	148
The water cycle	148
Streams	149
Soil-plant-atmosphere continuum	156
General characteristics of stream organisms	161
Natural impoundments	165
The estuary	170
Conclusions	171
Further reading	171
NINE Island environments	172
Introduction	172
The physical geographic setting of islands	172
Biotic features of islands	176
Characteristics of the patterns of island life	181
Mountain tops, refugia, and other islands	185
Evolutionary significance of islands	187
Human disruption of islands	188
Conclusions	192
Further reading	193
TEN Environments linked through animal movements	194
Introduction	194
Skills and aids required for navigation	194
Navigation feats of organisms	195
The origin of flight	197
Bird migration	198
Insect migration	205
Fish migrations	206
Migration among mammals	208
Conclusions	212
Further reading	213
ELEVEN Organisms and environments integrated through coevolution	214
Introduction	214
The compartment and transfer model	216
Plant-to-plant relationships	217
Plant-soil relationships	217
Plant-animal interactions	222
Animal-animal relationships: predators and prey	227

CONTENTS

Animal–soil relationships: biogeochemical dynamos 231  
    Conclusions 237  
    Further reading 237

PART FOUR THE HUMAN IMPACT 239

TWELVE Fire as an old and new agent of change 241

    Introduction 241  
    Attributes of humans and other animals 241  
    Metabolism of animals and humans 242  
    Evolution of fire as a human cultural tool 243  
        Carbon dioxide 248  
        Acid rain 251  
        Nuclear winter 257  
    Conclusions 260  
    Further reading 261

THIRTEEN Man the maker and exterminator of plants and animals 262

    Introduction 262  
    Human population growth 262  
    Subsistence diet of the hunter and gatherer 264  
        The plant diet and neolithic lifestyle 270  
        Plant domestication 272  
    The Columbian exchange 281  
    Conclusions 287  
    Further reading 288

FOURTEEN Biogeographic repercussions of the intensification of agriculture 289

    Introduction 289  
    The North American prairie: grassland to grainfield 289  
        The cultural evolution of till agriculture 293  
        Industrialization of till agriculture 298  
    The impact of agriculture on patterns of life 299  
    Plant breeding: expanding the perplexity of mechanized agriculture 309  
    Conclusions 311  
    Further reading 312

FIFTEEN The impact of urban–industrial development on patterns of life 313

    Introduction 313  
    The impact of petroleum and petrochemicals 313  
    Industrialization, urbanization, and population growth 317  
    Final conclusions 331  
    Further reading 336

References 337

Index 361

# LIST OF TABLES

- 1.1 Comparison of some physical properties of the planets of the Solar System 8
- 3.1 Comparison of the partial pressures of constituent gases, in millibars, of the atmospheres of Venus, Earth, and Mars 41
- 3.2 Major differences between prokaryotes and eukaryotes 45
- 3.3 The carbon reservoirs of the Earth 49
- 4.1 Closely related plants separated by Wallace's Line 72
- 5.1 Estimated volume of present ice and glacial age ice 85
- 5.2 The most prominent of the former Quaternary land bridges 87
- 5.3 Number of genera, appearances, and extinctions of North American mammals during glacial and interglacial periods of the Quaternary 89
- 5.4 Related species of genera shared between southeast Canada and northern Europe 96
- 6.1 Volcanic dust ejection of selected volcanic events 122
- 7.1 The principal constituent elements of sea water 127
- 7.2 Comparison of light penetration of sea water at nearshore and offshore sites 128
- 7.3 Abundance of elements of the Earth's crust compared with the abundance of the elements in plants 143
- 7.4 The major currents 146
- 8.1 The major water reservoirs of the Earth 149
- 8.2 The major river basins of the Earth, ranked by discharge 154
- 8.3 Comparison of the chemical inputs and outputs of undisturbed and disturbed drainage basins 158
- 8.4 Comparison of physical and chemical characteristics of mineral and peat soils 166
- 9.1 Area and relief of New Zealand and neighboring islands 175
- 9.2 Climatic data for New Zealand and neighboring islands 175
- 9.3 Relative dispersal capabilities of major groups of organisms 182
- 9.4 Impoverishment as measured by the ratio of species per genus for New Zealand and neighboring islands 183
- 10.1 Palearctic-African bird migration 200
- 10.2 Number of Nearctic breeding species and number of species wintering in various regions 203
- 12.1 Geologic trend of the ratio of brain to body size among mammalian herbivores and carnivores 242
- 12.2 Approximate daily per capita energy use of various societies 247
- 12.3 Fuel changes in the United States from 1850 to 1975 252
- 12.4 Places exhibiting signs of forest die-back 256
- 13.1 The major periods and rates of growth of the human population 264
- 13.2 The late Pleistocene extinct and living genera of terrestrial megafauna of four continents 268

LIST OF TABLES

- 13.3 Major food crops and their place of domestication 282
- 15.1 Number of people by percent of the total population living in cities of over 20,000 inhabitants between 1800 and 1980 and projected to 2000 318
