CONTENTS

Preface	xi
Contributors	xvii
Acknowledgements	xxiii
1. Plasmid Replication and Copy Number Control	1
<i>M. Espinosa, S. Cohen, M. Couturier, G. del Solar, R. Diaz-Orejas, R. Giraldo, L. Jänniere, C. Miller, M. Osborn and C.M. Thomas</i>	
1.1. Introduction	1
1.2. Theta Replicons	3
1.3. Theta Replicons Independent of DNA Pol I	4
1.3.1. Rep families	4
1.3.2. Iteron-containing replicons: structure of the origins of replication and mechanisms of replication	5
1.3.3. Control of replication	9
1.3.4. Some representative iteron-type replicating plasmids	11
1.3.5. Theta-type replicon that does not rely on iterons: the IncFII replicon	14
1.3.6. Host range and environmental factors	14
1.4. DNA Polymerase I-Dependent Replicons	15
1.4.1. Plasmid families	15
1.4.2. Mechanisms of initiation of DNA replication	19
1.4.3. Primer synthesis for Pol I-directed polymerisation	19
1.4.4. Pol I entry and propagation	21
1.4.5. Replisome assembly	22
1.4.6. Copy-number control	22
1.5. Rolling Circle Replication	23
1.5.1. Organization of RCR-plasmids	25
1.5.2. Double strand origins	25
1.5.3. Rep proteins	27
1.5.4. Initiation, elongation, and termination of RCR	28
1.5.5. Lagging strand replication	29
1.5.6. Control of replication of RCR-plasmids	32
1.5.7. Identification of RCR-plasmids	34
1.6. Replication of <i>Streptomyces</i> Linear Plasmids	35
1.7. Summary and Conclusions	38
References	39

2. Plasmid Maintenance Systems	49
<i>K. Gerdes, S. Ayora, I. Canosa, P. Ceglowski, R. Díaz-Orejas, T. Franch, A.P. Gulyaev, R. Bugge Jensen, I. Kobayashi, C. Macpherson, D. Summers, C.M. Thomas and U. Zielonkiewicz</i>	
2.1. Introduction	49
2.2. Multimer Resolution Systems	49
2.2.1. Site-specific recombinases	50
2.2.2. The <i>cer</i> site of plasmid ColE1	51
2.2.3. Site-specific recombinases encoded by plasmids of Gram-positive bacteria	51
2.3. Active Partitioning Systems	53
2.3.1. The <i>par/sop</i> family (<i>minD</i> homologous family)	54
2.3.2. The <i>parA</i> family (<i>ftsA</i> homologous family)	57
2.3.3. Models for plasmid partitioning	59
2.4. Post-segregational Killing Systems (PSK)	60
2.4.1. Antisense RNA regulated PSK systems	60
2.4.2. Proteic plasmid stabilization systems	64
2.4.3. A novel proteic plasmid stabilization system from Gram-positive bacteria	66
2.4.4. Restriction modification systems	67
2.5. Conclusions and Perspective	74
References	75
3. Conjugative-DNA Transfer Processes	87
<i>E.L. Zechner, F. de la Cruz, R. Eisenbrandt, A.M. Grabn, G. Koraimann, E. Lanka, G. Muth, W. Pansegrau, C.M. Thomas, B.M. Wilkins and M. Zatyka</i>	
3.1. Introduction	87
3.2. Transfer Systems of Gram-Negative and Gram-Positive Bacteria	88
3.2.1. Plasmids from Gram-negative organisms	88
3.2.2. Plasmids from Gram-positive organisms	92
3.3. Mechanistic Principles	93
3.3.1. The IncF mating pair formation system	93
3.3.2. The IncP mating pair formation system	96
3.3.3. Gram-positive	104
3.3.4. DNA processing reactions	105
3.4. Establishment of Transmitted Genetic Information in the Recipient Cell	116
3.4.1. Circularisation of the transferring DNA strand	116
3.4.2. Synthesis of the complementary DNA strand	117
3.4.3. Plasmid DNA primases	117
3.4.4. 'Early' genes in the plasmid leading region	118
3.4.5. Surface exclusion and immunity to lethal zygosis	120
3.5. Regulation and Induction of Transfer Systems	121
3.5.1. The IncF system	121
3.5.2. The IncP system	126

3.5.3.	Ti plasmids of <i>Agrobacterium tumefaciens</i>	129
3.5.4.	Pheromone responding plasmids	133
3.6.	Comparison of Properties of Gram-negative and Gram-positive Transfer Systems	136
3.7.	Relationships Between DNA Transfer Systems	137
3.7.1.	DNA processing systems	138
3.7.2.	Mating pair formation systems	143
3.7.3.	Relationships to other macromolecular export systems	146
3.8.	Conclusions	154
	References	155
4.	Ecology of Plasmid Transfer and Spread	175
	<i>J.D. van Elsas, J. Fry, P. Hirsch and S. Molin</i>	
4.1.	Introduction	175
4.2.	Plasmid Transfer and Spread: from the Test Tube to the Field	176
4.2.1.	Ecological factors affecting plasmid transfer in natural habitats	178
4.3.	Plasmid Transfer in Soil, the Rhizosphere and on Plant Surfaces	179
4.3.1.	Soil sites and plant surfaces as habitats for bacteria	180
4.3.2.	Plasmid hosts and their ecology in soil	181
4.3.3.	Demonstration of gene transfer in soil systems: occurrence and scope	181
4.3.4.	Effects of different factors on conjugative plasmid transfer in soil and related environments	183
4.3.5.	Barrier effect of soil to plasmid transfers	186
4.4.	Plasmid Transfer in Aquatic Habitats	187
4.4.1.	Aquatic systems as habitats for bacteria	187
4.4.2.	Plasmid hosts and their ecology in aquatic environments	188
4.4.3.	Demonstration of plasmid transfers in aquatic microcosms and <i>in situ</i> : occurrence and scope	192
4.4.4.	Effects of different factors on conjugative plasmid transfer in aquatic environments	192
4.4.5.	Plasmid transfer in sewage filter beds and activated sludge units	195
4.5.	<i>In situ</i> Monitoring of Plasmid Transfer in Biofilms	197
4.6.	Concluding Remarks and Prospects for Further Study	198
	References	199
5.	Isolation and Characterisation of Plasmids from Bacteria	207
	<i>K. Smalla, M. Osborn and E.M.H. Wellington</i>	
5.1.	Introduction	207
5.2.	Plasmid Isolation	208
5.2.1.	Sampling strategies	208
5.2.2.	Plasmid isolation techniques	209

5.2.3.	Detection of plasmids in total microbial community DNA	215
5.3.	Plasmid Characterisation	219
5.3.1.	Transfer of the plasmid into a well-characterised host	219
5.3.2.	Physical isolation of plasmid DNA	221
5.3.3.	Functions encoded by heterologous plasmid DNA	223
5.3.4.	Phenotypes encoded by the plasmid backbone	227
5.3.5.	The genotype of the plasmid "backbone"	230
5.3.6.	Plasmid classification in the past and in the future	239
	References	240
6.	Phenotypic Traits Conferred by Plasmids	249
	<i>E.M. Top, Y. Moëne-Loccoz, T. Pembroke and C.M. Thomas</i>	
6.1.	Introduction	249
6.2.	Plasmid Encoded Antibiotic Resistance: Mechanisms, Spread and Evolution	253
6.2.1.	Mechanisms of antibiotic resistance	253
6.2.2.	Tetracycline resistance	255
6.2.3.	Aminoglycoside-modifying enzymes	256
6.2.4.	Chloramphenicol resistance	256
6.2.5.	Resistance to antibiotics from the MLS group	257
6.2.6.	β -lactam resistance	257
6.2.7.	Spread, transfer and evolution of resistance	259
6.3.	The Role of Plasmids in the Adaptation of Bacteria to Organic Pollutants	263
6.3.1.	Genes encoding <i>meta</i> -cleavage pathways	266
6.3.2.	Genes encoding <i>ortho</i> -cleavage pathways	269
6.3.3.	Genes encoding modified <i>ortho</i> -cleavage pathways	269
6.3.4.	Gene transfer in the evolution of degradative ability	271
6.4.	Plasmid Encoded Phenotypes and Adaptation of Rhizobia to Transient, Complex Ecological Niches	272
6.4.1.	Rhizobial plasmids and the nitrogen-fixing symbiosis	272
6.4.2.	Plasmids and saprophytism of free-living rhizobia	273
6.4.3.	Significance of plasmids in rhizobia	275
6.5.	General Conclusions	275
	References	276
7.	Bacterial Population Genetics: Do Plasmids Maintain Bacterial Diversity and Adaptation?	287
	<i>A. Lilley, P. Young and M. Bailey</i>	
7.1.	Introduction	287
7.2.	Are Plasmids Parasitic?	289
7.3.	Coevolution	291
7.4.	Plasmids and Sex	292
7.5.	Plasmids and Adaptation	295
7.6.	Conclusion	296
	References	297

8. The Evolution of Bacterial Plasmids	301
<i>M. Osborn, S. Bron, N. Firth, S. Holsappel, A. Huddleston, R. Kiewiet, W. Meijer, J. Seegers, R. Skurray, P. Terpstra, C.M. Thomas, P. Thorsted, E. Tietze and S.L. Turner</i>	
8.1. Introduction	301
8.1.1. Plasmid structure	301
8.1.2. Towards a definition of plasmid evolution	303
8.1.3. Systems for assessing the relationships between plasmids	305
8.2. Systems for Studying Plasmid Evolution	306
8.2.1. Evolution of staphylococcal plasmids	306
8.2.2. <i>Bacillus subtilis</i> plasmids	314
8.2.3. Plasmids in <i>Lactococcus lactis</i>	318
8.2.4. Biological diversity among a family of IncQ-like plasmids	321
8.2.5. The IncP plasmid family	330
8.2.6. An evolutionary overview of rhizobial plasmids	331
8.2.7. Progress in determining the evolutionary origins of actinomycete linear plasmids	335
8.3. Evolutionary Relationships Among Plasmid Systems	337
8.3.1. Emergence of replicon families	337
8.3.2. Mechanisms of evolution of new plasmid incompatibility groups	341
8.3.3. Recombination between replicons	342
8.3.4. Non selective divergence via cointegrate formation	344
8.4. Summary and Conclusions	346
References	347
9. Gene Recruiters and Transporters: The Modular Structure of Bacterial Mobile Elements	363
<i>C. Merlin, J. Mabillon, J. Nešvera and A. Toussaint</i>	
9.1. Introduction	363
9.2. Bacterial Transposable Elements: Structure, Organization and Diversity	363
9.2.1. Insertion sequences and class I composite transposons	364
9.2.2. Class II elements	369
9.2.3. Tn7	370
9.2.4. Transposable phages: the Mu paradigm	370
9.2.5. Conjugative transposons	371
9.2.6. Integrons	374
9.3. Mechanisms Involved in DNA Mobility	374
9.3.1. Recombination modules	374
9.3.2. Replicative vs. conservative transposition	377
9.3.3. Transposases	379
9.3.4. Integration/excision: the case of the conjugative transposons	381
9.3.5. Integrases	384
9.3.6. Resolution and inversion	386

9.3.7.	Resolvases and invertases	388
9.3.8.	A common theme for transposition: cut and paste of DNA segments	388
9.4.	The Gene Transporters	390
9.5.	The Modular Structure of Mobile Elements	391
9.5.1.	Integrations and IS, the basic rearranger modules: selfish vs. cell fish, or ego vs. lego	392
9.5.2.	Other basic functional modules required to build up mobile elements	396
9.5.3.	More functional modules	397
9.5.4.	The versatility of functional modules	398
9.5.5.	Control of mobile elements assembly, maintenance and activities	400
9.6.	Concluding Remarks	401
	References	402
	Index	411
