Applied Simulation of Marine Communities with Reference to the Fouling Community

by Mikhail Vladimirovich Gal'perin

With 48 Figures and 29 Tables

Akademie-Verlag Berlin

Contents

Introduction 11

1. Theoretical Fundamentals of Simulating Marine Ecosystems 16
   1.1. Basic Definitions 16
   1.2. Simulation and Its Application in Marine Ecology 18
   1.3. Biological Concepts and Description of the System 25
   1.4. A Method of Developing a Simulation Model of the Fouling Community 28

2. Simulation Study of the Development and Functions of Community Species without Regarding Interspecific Relations (Autonomous Models) 37
   2.1. A Hydroid Population Model 37
   2.2. A Balanus Population Model 52
   2.3. Nudibranch and Infusorian Population Models 68
   2.4. The Crab Population Model 76
   2.5. Statistical Analysis of Empirical Relations and Results from Autonomous Models 94

3. Simulation Study of the Fouling Community by the Proposed Applied Methods 102
   3.1. Flowchart and Description of Interspecific Relations in the Community 102
   3.2. The Simulation Model of the Fouling Community. A Mathematical Description 105
   3.3. Computer Simulation of the Fouling Community 113
   3.4. Adequacy Estimation of the Simulation Model 124
   3.5. Statistical Significance of the Results and Analysis of the Impact Made by the Computation Method 133
   3.6. Dynamic Forecasting of System Functioning Modes and of Basic Community Characteristics for Various Model Functioning Conditions 137
   3.7. Dynamic Forecasting of Basic Community Characteristics for Various Food Concentrations and Salinities. Model Sensitivity to Paremeter Manipulation 143

4. Biological Control of Bottom Community Development and Principles of the Event Approach to Simulation in Marine Ecology 153
4.1. On Two Mathematical Approaches to Controlling Biologically the Evolution of Bottom Communities 153
4.2. Principles of Computer-Aided Event Simulation in Marine Biology 174

Appendix 194
