<i>Preface</i>	<i>page</i> xiii
<i>Contributors</i>	xvii
<b>PART ONE The Early Earth</b>	<b>1</b>
<b>1 Do the Geological and Geochemical Records of the Early Earth Support the Prediction from Global Phylogenetic Models of a Thermophilic Cenancestor?</b>	<b>3</b>
<b>John A. Baross</b>	
1.1 Introduction	3
1.2 Was the early earth hot, warm or cold?	4
1.3 Were the early organisms mesophiles, thermophiles or hyperthermophiles?	9
1.4 Conclusions	13
1.5 Summary	14
References	15
<b>2 The Early Diversification of Life and the Origin of the Three Domains: A Proposal</b>	<b>19</b>
<b>Otto Kandler</b>	
2.1 Introduction	19
2.2 Towards a universal phylogenetic 'bush'	19
2.3 Origin of the proto-cells of the three domains	21
2.4 Origin and evolution of the domain Bacteria	23
2.5 Origin and evolution of the domain Archaea	24
2.6 Origin and evolution of the domain Eukarya	25
2.7 The fate of the progenotic and pre-cellular life on earth	26
2.8 Extraterrestrial life?	27
2.9 Conclusion	27
2.10 Summary	27
References	28

<b>3</b>	<b>Life was Thermophilic for the First Two-thirds of Earth History</b>	<b>33</b>
	<b>David W. Schwartzman</b>	
3.1	Introduction	33
3.2	A case for thermophilic surface conditions for the Archaean/Early Proterozoic (3.5–1.5 Ga)	35
3.3	A geophysical model of biospheric evolution	38
3.4	Conclusions	39
3.5	Summary	39
	References	41
	<b>PART TWO The Origin of Life</b>	<b>45</b>
<b>4</b>	<b>The Case for a Hyperthermophilic, Chemolithoautotrophic Origin of Life in an Iron–Sulfur World</b>	<b>47</b>
	<b>Günter Wächtershäuser</b>	
4.1	Introduction	47
4.2	General mechanism of evolution	48
4.3	Thermophilic surface metabolism	48
4.4	The universal pattern of metabolism	49
4.5	Rules of retrodiction	49
4.6	The primordial pathway of initiation	51
4.7	The alpha cycle	52
4.8	The earliest vitalisers	53
4.9	The genetic machinery	54
4.10	The thermal irreversibility of evolution	55
4.11	Conclusions	56
4.12	Summary	56
	References	56
<b>5</b>	<b>The Emergence of Metabolism from Within Hydrothermal Systems</b>	<b>59</b>
	<b>Everett L. Shock, Tom McCollom and Mitchell D. Schulte</b>	
5.1	Introduction	59
5.2	The energetics of methanogenesis in submarine hydrothermal ecosystems	60
5.3	The energetics of acetogenesis in submarine hydrothermal ecosystems	62
5.4	Amino acid synthesis hydrothermal ecosystems	64
5.5	The potential for hydrothermal organic synthesis	67
5.6	Hydrothermal organic synthesis versus organic destruction in hot water	71
5.7	Conclusions	72
5.8	Summary	73
	References	74
<b>6</b>	<b>The Emergence of Life from FeS Bubbles at Alkaline Hot Springs in an Acid Ocean</b>	<b>77</b>
	<b>Michael J. Russell, Dan E. Daia and Allan J. Hall</b>	
6.1	Introduction	77
6.2	Scale and approach	78

6.3	Model	79
6.4	Clues from hydrothermal orebodies	82
6.5	Clues from metabolism	84
6.6	Clues from hydrothermal geochemistry	85
6.7	Overcoming the kinetic barrier to carbon dioxide reduction	86
6.8	Indications from mineralogy	105
6.9	Clues from metalloenzymes	111
6.10	Tensions across the membrane	114
6.11	Discussion	114
6.12	Conclusions	114
6.13	Summary	115
	References	116
<b>7</b>	<b>Facing Up to Chemical Realities: Life Did Not Begin at the Growth Temperatures of Hyperthermophiles</b>	<b>127</b>
	<b>Stanley L. Miller and Antonio Lazcano</b>	
7.1	Introduction	127
7.2	The antiquity of hyperthermophiles	127
7.3	Hyperthermophiles may be ancient, but they are hardly primitive	128
7.4	What was the physical environment of the origin of life?	129
7.5	High temperatures give higher reaction rates, but the lifetimes of organic molecules are drastically reduced	130
7.6	Hyperthermophily may be a derived character	130
7.7	Conclusion	131
7.8	Summary	131
	References	131
	<b>PART THREE Nucleic Acid-based Phylogenies</b>	<b>135</b>
<b>8</b>	<b>Were our Ancestors Actually Hyperthermophiles? Viewpoint of a Devil's Advocate</b>	<b>137</b>
	<b>Patrick Forterre</b>	
8.1	Introduction	137
8.2	The conflict between primitiveness and hyperthermophily?	137
8.3	What does the universal tree of life say?	138
8.4	A perspective from comparative biochemistry	141
8.5	Conclusions	144
8.6	Summary	144
	References	144
<b>9</b>	<b>Hyperthermophilic and Mesophilic Origins of the Eukaryotic Genome</b>	<b>147</b>
	<b>James A. Lake, Ravi Jain, Jonathan Moore and Maria C. Rivera</b>	
9.1	Introduction	147
9.2	Prokaryotic diversity	147
9.3	Origin of the eukaryotes	148

9.4	Using sequence inserts and operon organisation to map eukaryotic origins	154
9.5	Conclusions	159
9.6	Summary	159
	References	159
<b>PART FOUR Gene Exchange and Evolution</b>		<b>163</b>
<b>10</b>	<b>Deciphering the Molecular Record for the Early Evolution of Life: Gene Duplication and Horizontal Gene Transfer</b>	<b>165</b>
	<b>Lorraine Olendzenski and J. Peter Gogarten</b>	
10.1	Introduction	165
10.2	Duplicated genes and rooted phylogenies	166
10.3	Catalytic H <sup>+</sup> -ATPase subunits	166
10.4	Conflicting molecular phylogenies	168
10.5	Two distinct prokaryotic domains?	169
10.6	Open questions	171
10.7	Properties of the last common ancestor	172
10.8	Conclusions	172
10.9	Summary	173
	References	174
<b>11</b>	<b>Lateral Gene Exchange, an Evolutionary Mechanism for Extending the Upper or Lower Temperature Limits for Growth of Microorganisms? A Hypothesis</b>	<b>177</b>
	<b>Juergen Wiegel</b>	
11.1	Evolution and horizontal gene transfer	177
11.2	Overview of bacteria with an extended temperature range for growth and a biphasic Arrhenius plot for growth	178
11.3	Hypothesis	179
11.4	Examples of gene products which support the hypothesis of the two sets of genes	180
11.5	Critical assessment of the hypothesis	181
11.6	Conclusion	183
11.7	Summary	183
	References	184
<b>12</b>	<b>Evidence in Anaerobic Fungi of Transfer of Genes Between Them from Aerobic Fungi, Bacteria and Animal Hosts</b>	<b>187</b>
	<b>Lars G. Ljungdahl, Xin-Liang Li and Huizhong Chen</b>	
12.1	Introduction	187
12.2	Gene duplication	188
12.3	Gene transfer between anaerobic fungi	191
12.4	Genes of fungal origin	191
12.5	Genes of bacterial origin	192
12.6	Genes of animal origin	193

12.7	Conclusions	194
12.8	Summary	195
	References	195
<b>PART FIVE Enzyme-based Phylogenies</b>		<b>199</b>
<b>13</b>	<b>DNA Topoisomerases, Temperature Adaptation, and Early Diversification of Life</b>	<b>201</b>
	<b>Purificación López-García</b>	.
13.1	Introduction	201
13.2	Homeostasis of DNA geometry	203
13.3	Gyrase and reverse gyrase: did early prokaryote diversification correlate with adaptation to distinct temperature niches?	207
13.4	Conclusions	212
13.5	Summary	212
	References	213
<b>14</b>	<b>Aminoacyl-tRNA Synthetases: Evolution of a Troubled Family</b>	<b>217</b>
	<b>James R. Brown</b>	
14.1	Aminoacyl-tRNA synthetase structure and function	217
14.2	Rooting the universal tree	220
14.3	Charging for glutamine, asparagine and lysine are the exceptions	221
14.4	Loss and gain of aminoacyl-tRNA synthetases	224
14.5	Up-rooting the universal tree	226
14.6	Summary	228
	References	228
<b>15</b>	<b>The Evolutionary History of Carbamoyltransferases: Insights on the Early Evolution of the Last Universal Common Ancestor</b>	<b>231</b>
	<b>Bernard Labedan and Anne Boyen</b>	
15.1	Introduction	231
15.2	Ornithine carbamoyltransferases and aspartate carbamoyltransferases are evolutionarily related proteins	231
15.3	Phylogenetic study of carbamoyltransferases	233
15.4	A possible scenario for the evolutionary history of carbamoyltransferases	236
15.5	Conclusions	238
15.6	Summary	238
	References	238
<b>PART SIX Enzyme Evolution</b>		<b>241</b>
<b>16</b>	<b>Evolution of the Histone Fold</b>	<b>243</b>
	<b>Kathleen Sandman, Wenlian Zhu, Michael F. Summers and John N. Reeve</b>	
16.1	Introduction	243
16.2	Archaeal histones	243
16.3	Eukaryal histones	249

16.4	Histone fold motifs in eukaryal proteins	249
16.5	Conclusions	250
16.6	Summary	251
	References	251
<b>17</b>	<b>Comparative Enzymology as an Aid to Understanding Evolution</b>	<b>255</b>
	<b>Michael J. Danson, Rupert J. M. Russell, David W. Hough and Garry L. Taylor</b>	
17.1	Introduction and aims	255
17.2	Central metabolism withing the Archaea	256
17.3	The enzymes of central metabolism	261
17.4	Do archaeal enzymes represent the minimal functional unit?	262
17.5	Does metabolite stability control the upper temperature limit of life?	263
17.6	Conclusions and future trends in archaeal enzymology	264
17.7	Summary	265
	References	265
<b>18</b>	<b>Pyrophosphate-dependent Phosphofructokinases in Thermophilic and Nonthermophilic Microorganisms</b>	<b>269</b>
	<b>Hugh W. Morgan and Ron S. Ronimus</b>	
18.1	Phosphoryl donors of phosphofructokinase and their distribution	269
18.2	Phylogeny and evolution of the different types of PFK	271
18.3	Phosphofructokinase activity in spirochaetes	273
18.4	Conclusions	275
18.5	Summary	275
	References	275
	<b>PART SEVEN Membrane Evolution</b>	<b>279</b>
<b>19</b>	<b><i>sn</i>-Glycerol-1-phosphate Dehydrogenase: A Key Enzyme in the Biosynthesis of Ether Phospholipids in Archaea</b>	<b>281</b>
	<b>Masateru Nishihara, Takayuki Kyuragi, Nobuhito Sone and Yosuke Koga</b>	
19.1	Introduction	281
19.2	<i>M. thermoautotrophicum</i> G-1-P dehydrogenase	282
19.3	GP dehydrogenase and glycerol kinase in other Archaea	282
19.4	Conclusion	283
19.5	Summary	283
	References	284
<b>20</b>	<b>From the Common Ancestor of all Living Organisms to Protoeukaryotic Cell</b>	<b>287</b>
	<b>Akihiko Yamagishi, Takahide Kon, Gen Takahashi and Tairo Oshima</b>	
20.1	Introduction	287
20.2	The last common ancestor commonote	287
20.3	The process from the protoarchaebacteria to protoeukaryotic cells	290
20.4	Conclusions	293

20.5	Summary	294
	References	294
<b>PART EIGHT Life at High Temperature</b>		<b>297</b>
<b>21</b>	<b>Primitive Coenzymes and Metabolites in Archaeal/Thermophilic Metabolic Pathways</b>	<b>299</b>
	<b>R. M. Daniel</b>	
21.1	Introduction	299
21.2	Macromolecular stability	299
21.3	Coenzyme and metabolite stability: general considerations	301
21.4	NAD(P) stability and the role of non-haem iron proteins	303
21.5	The stability of phosphorylated coenzymes and metabolites	305
21.6	Conclusions	306
21.7	Summary	307
	References	307
<b>22</b>	<b>3-Phosphoglycerate Kinase and Triose-phosphate Isomerase from Hyperthermophilic Archaea: Features of Biochemical Thermoadaptation</b>	<b>311</b>
	<b>Reinhard Hensel, Alexander Schramm, Daniel Hess and Rupert J. M. Russell</b>	
22.1	Introduction	311
22.2	Quaternary structure of the PGK and TIM from mesophilic and thermophilic Archaea	312
22.3	Homology-based models for the subunit assembly of PGK and TIM from the hyperthermophilic <i>M. fervidus</i> and <i>P. woesei</i>	313
22.4	Thermoadaptation through oligomerisation – a common strategy?	318
22.5	Following the direction of thermoadaptation – a hypothetical approach	318
22.6	Conclusions	320
22.7	Summary	321
	References	321
<b>23</b>	<b>The Evolutionary Significance of the Metabolism of Tungsten by Microorganisms Growing at 100 °C</b>	<b>325</b>
	<b>Michael W. W. Adams</b>	
23.1	Introduction	325
23.2	Role of tungsten in the metabolism of <i>Pyrococcus furiosus</i>	326
23.3	Properties of the tungstoenzymes	327
23.4	Tungsten- and molybdenum-containing isoenzymes	331
23.5	Why tungsten and not molybdenum?	332
23.6	Evolutionary considerations	333
23.7	Conclusions	335
23.8	Summary	336
	References	337
	<b>Index</b>	<b>339</b>
