Spatial Optimization for Managed Ecosystems

John Hof and Michael Bevers

Columbia University Press
New York

CONTENTS

Series Editors' Foreword xi

Preface xix

1 Introduction 1

Viewpoint 1
Organization 2
Methods 5
Solvability of (0-1) Integer Programs 6
Solvability of Nonlinear Programs 7
A Final Introductory Note 8

PART I Static Spatial Relationships 11

2 A Cellular Model of Wildlife Habitat Spatial Relationships 14

Edge Effects 16
Wildlife Habitat Fragmentation Effects 18
Wildlife Habitat Size Thresholds 22
An Example 22
The Problem 22
Results 24
Discussion 28
Appendix 31

3 A Geometric Model of Wildlife Habitat Spatial Relationships 35

Spatial Effects 36
An Example 36
Results 40
Discussion 44

4	Spatial Supply-Demand Equilibrium: A Recreation Example	46
	The Travel Cost Model	46
	The Case of More Than One Proposed Site	47
	A Spatial Recreation Allocation Model	48
	An Example	52
	The Problem	52
	Results	55
	Discussion	58
PART II	Spatial Autocorrelation	59
	Chance-Constrained Programming	60
	Individual Chance Constraints	60
	Joint Probability Chance Constraint	61
	Total Probability Chance Constraint	62
	Chance-Maximizing Programs	63
	MAXMIN Chance-Maximizing Programming	63
	Joint Probability Chance-Maximizing Programming	65
	Total Probability Chance-Maximizing Programming	65
	Approximation of the CDF	66
5	A Cellular Timber Model with Spatial Autocorrelation	68
	An Example	69
	The Problem	69
	Results	73
	Discussion	80
6	A Geometric Wildlife Model with Spatial Autocorrelation and Habitat Connectivity	81
	Theory	82
	Connectivity	82
	Spatial Autocorrelation	83
	Chance Maximization	84
	Optimization	84
	Circles	85
	Rectangles	87
	An Example	90
	The Problem	90
	Results	91
	Discussion	97
7	Pragmatic Approaches to Handling Risk and Uncertainty	99
	The Problem	99

Post-Optimization Calculations 100
An Example 101
Row-Total Variance Reduction 107

PART III Dynamic Movement 113

Methods 114

8 A Cellular Model of Wildlife Population Growth and Dispersal 118

The Model 119
An Example 122
The Problem 122
Results 124
Continuous Choice Variables 129
Results 130
Discussion 134

9 The Black-Footed Ferret: A Case Study 135

Spatial Optimization Model 136
Ferret Reintroduction in South Dakota 141
Spatial Definition 142
Ferret Dispersal 142
Net Population Growth Rate 143
Ferret Releases 143
Ferret Carrying Capacity 144
Model Results 145

10 A Cellular Model of Pest Management 153

The Model 154
An Example 159
The Problem 159
Results 160
Discussion 169

11 A Nested-Schedule Model of Stormflow 170

The Spatial Optimization Approach 171
Two Examples 176
Results 181
Discussion 184

PART IV Diversity and Sustainability 187

12 Species Richness Objective Functions 191

Determining the Optimal Steady State 192

A Steady-State Example 195
Results 196
Allocation over Time and Space 201
Results 203
Appendix 205
Declining Monotonicity of Natural Logarithm Transformations 206
The Logistic Distribution 207

13 Sustainability of Species Richness 208

The Modeling Approach 208
Objective Functions 209
A Coastal Douglas-fir Case Study 212
Linear Approximation of Objective Functions 213
Model Reduction 215
Sensitivity to Minimum Harvest Age 215
Sensitivity to Planning Horizon Length 221
Accounting for Mortality 222
Single-Species Emphasis 223
A New Definition for a Regulated Forest 224
Appendix 227

14 Synthesis 230

An Adaptive Management Context 231
Simulation Versus Optimization 234

References 237
