# **Enzyme Assays**

## **Second Edition**

### **A Practical Approach**

Edited by

**Robert Eisenthal**

and

**Michael J. Danson**

Department of Biology and Biochemistry,  
University of Bath, Bath, BA2 7AY U.K.

**OXFORD**  
UNIVERSITY PRESS

# Contents

List of protocols *page xiii*

Abbreviations *xvii*

## **1 Principles of enzyme assay and kinetic studies 1**

*Keith F. Tipton*

- 1 Introduction 1
- 2 Behaviour of assays 1
  - Reaction progress curves 1
  - Initial rate measurements 5
  - Integrated rate equations 6
  - Bursts and lags in progress curves 7
  - Blank rates 11
- 3 The effects of enzyme concentration 15
  - Direct proportionality 15
  - Upward curvature 17
  - Downward curvature 18
- 4 Expression of enzyme activity 18
  - Units and specific activity 19
  - The katal 19
  - Stoichiometry 19
  - Conditions for activity measurements 20
- 5 The effects of substrate concentration 20
  - The Michaelis-Menten relationship 20
  - Failure to obey the Michaelis-Menten equation 21
- 6 Experimental approaches 29
  - Type of assay 29
  - Choice of assay method 38
  - The effects of pH 39
  - Practical considerations 40
  - Conclusions 44
  - References 44

## **2 Photometric assays 49**

*Robert A. John*

- 1 Introduction 49

- 2 Absorption 49
  - Terminology 49
  - Absorbance 50
  - Limitations and sources of error 52
  - Absorbance range 55
  - Measurement of low rates of absorbance change 55
  - Use of absorbance coefficient 56
  - Continuous assays 58
  - Discontinuous assays 63
  - Examples of enzymes assayed by absorbance change 64
- 3 Turbidimetry 70
- 4 Fluorescence 71
  - The fluorescence spectrometer 72
  - Quantitation of fluorescence 72
  - Causes of non-linearity - the inner filter effect 73
  - Examples of fluorimetric enzyme assays 73
  - References 77

### **3 Radiometric assays 79**

*Kelvin T. Hughes*

- 1 Introduction 79
- 2 Techniques 80
  - Ion-exchange methods 80
  - Precipitation of macromolecules 81
  - Solvent extraction methods 81
  - Paper and thin-layer chromatographic (TLC) methods 81
  - Electrophoretic methods 81
  - Scintillation Proximity Assay (SPA) 82
- 3 Experimental design 98
- 4 Microplate technology 99
- 5 Measurement of radioactivity 100
- 6 Automation of assays 100
  - Acknowledgements 100
  - References 100

### **4 High performance liquid-chromatographic assays 103**

*Shabih E. H. Syed*

- 1 Introduction 103
- 2 Theory of HPLC 103
  - Introduction 103
  - Chromatographic parameters 104
- 3 Retention mechanism 106
  - Characteristics of silica 106
  - Polymeric packings 107
  - Reverse phase chromatography 108
  - Influence of composition of mobile phase 111
  - Effect of pH and salts 112
  - Influence of temperature 112
  - Ion-pair chromatography 113

Ion-exchange resins 114  
 Size-exclusion chromatography 116

#### 4 Instrumentation 117

Essential components of an HPLC system 117  
 Pumps 117  
 Biocompatibility 118  
 Sample injection 118

#### 5 Detectors 119

UV/visible detectors 119  
 Fluorescent detectors 120  
 Refractive-index (RI) detectors 121  
 Electrochemical detectors 122  
 Radioactivity monitors 122

#### 6 Practical considerations 123

Selection of a chromatographic mode 123  
 Solvent selection 123  
 De-gassing and filtration of solvents 124  
 Sample preparation 124  
 Column packing 124  
 Column protection 125  
 Tubing 125

#### 7 Application of HPLC to enzymatic analysis 125

Hydrolases 125  
 Isomerases 127  
 Lyases 130  
 Ligases 133  
 Oxidoreductases 136  
 Transferases 136  
 References 137

### 5 Electrochemical assays: the oxygen electrode 141

*J. B. Clark*

- 1 Introduction 141
- 2 Theory and principles 141
- 3 Current/voltage relationships 142
- 4 Sensitivity 142
- 5 Calibration 142
- 6 Electrode systems 144
- 7 Polarographic assays 145
  - Tissue/organelle respiration studies 145
  - Specific enzyme studies 146
- References 148

### 6 Electrochemical assays: the nitric oxide electrode 149

*R. D. Hurst and J. B. Clark*

- 1 Introduction 149
- 2 Principles of detection 149
- 3 Principles of selectivity and sensitivity 149

## CONTENTS

- 4 Environmental influences 150
  - Temperature 150
  - Electrical interference 150
- 5 Membrane integrity and maintenance 151
- 6 Calibration 151
  - Calibration for liquid measurements 151
  - Calibration for gas-phase measurements 153
- 7 NO and cellular respiration studies 153
  - References 155

## **7 Electrochemical assays: the pH-stat 157**

*Keith Brocklehurst*

- 1 Introduction 157
- 2 The basis of pH-stat methodology 157
  - Principle and general approach 157
  - pH-stat components and their functions 158
  - Some limitations and sources of error 159
- 3 Commercial and custom-made pH-stat assemblies 159
  - The range of equipment 159
  - Some pH-stat systems described in the literature 159
- 4 General pH-stat procedure and specific protocols for some individual enzymes 162
  - Procedures 162
- 5 A systematic error in pH-stat assays of enzymes in haemolysates 168
- 6 Concluding comment 168
  - References 168

## **8 Enzyme assays after gel electrophoresis 171**

*Gunter M. Rothe*

- 1 Introduction 171
- 2 Preparation of enzyme extracts 171
  - Extraction of microorganisms 171
  - Animal soft tissues 172
  - Mammalian blood 173
  - Insects 173
  - Plant tissues 173
- 3 Principles of enzyme visualization 175
  - Methods to visualize oxidative enzymes 175
  - Methods to visualize transferases 177
  - Methods to visualize hydrolases 178
  - Methods to visualize lyases, isomerases and ligases 180
- 4 A compilation of protocols to visualize enzymes following electrophoretic separation 180
  - Staining protocols 184
  - Buffer systems for electrophoresis 201
- References 206

## **9 Techniques for enzyme extraction 209**

*Nicholas C. Price and Lewis Stevens*

- 1 Introduction: scope of the chapter 209

- 2 Disruption of tissues and cells 210
  - Choice of tissue 210
  - Disruption of tissue and separation of cells 211
  - Disruption of cells 212
- 3 Protection of enzyme activity 215
  - Control of pH 215
  - Control of temperature 215
  - Control of proteolysis 216
  - Protection of thiol groups 217
  - Protection against heavy metals 217
  - Control of mechanical stress 218
  - Effects of dilution 218
- 4 Assays of enzymes in unfractionated cell-extracts 219
  - The presence of endogenous inhibitors 219
  - Interference from other reactions 219
  - Removal of substrate 219
  - Turbidity of extract 220
- 5 Concluding remarks 220
  - References 220
  - Appendix 1 Buffers and control of pH 221
  - Appendix 2 The determination of protein 223
  - References for Appendices 224

## **10 Determination of active site concentration 225**

*Mark T. Martin*

- 1 Introduction 225
- 2 Areas of application 225
- 3 Categories of titration methods 226
  - Activity bursts 226
  - Inhibitor titration 228
  - Special techniques 230
- References 233

## **11 High throughput screening – considerations for enzyme assays 235**

*David Hayes and Geoff Mellor*

- 1 Introduction 235
- 2 The drug discovery process 235
  - A historical perspective 235
  - A model of drug discovery 236
- 3 High throughput screening 237
  - Compounds for screening 239
  - Considerations for high throughput assays 240
- 4 Enzymatic considerations 245
- 5 Assay formats for enzymatic HTS 246
- 6 Automation 246
- 7 Developments 247
  - Higher density plates 247
- References 247

**12 Statistical analysis of enzyme kinetic data 249**

*Athel Cornish-Bowden*

- 1 Introduction 249
  - 2 Derivation of relationships 250
  - 3 Defining objectives 250
  - 4 Basic assumptions of least squares 251
  - 5 Fitting the Michaelis-Menten equation 252
  - 6 Equations with more than two parameters 258
  - 7 Detecting lack of fit 258
  - 8 Estimating pure error 260
  - 9 Distribution-free methods 262
  - 10 Residual plots 264
  - 11 A note about rounding 267
- References 268

**List of suppliers 269**

**Enzyme index 273**

**General index 277**
