Preface

vii

Part I Basic Statistical Methods and Financial Applications

1	Linear Regression Models	3
1.1	Ordinary least squares (OLS)	4
1.1.1	Residuals and their sum of squares	4
1.1.2	Properties of projection matrices	5
1.1.3	Properties of nonnegative definite matrices	6
1.1.4	Statistical properties of OLS estimates	7
1.2	Statistical inference	8
1.2.1	Confidence intervals	8
1.2.2	ANOVA (analysis of variance) tests	10
1.3	Variable selection	12
1.3.1	Test-based and other variable selection criteria	12
1.3.2	Stepwise variable selection	15
1.4	Regression diagnostics	16
1.4.1	Analysis of residuals	17
1.4.2	Influence diagnostics	18
1.5	Extension to stochastic regressors	19
1.5.1	Minimum-variance linear predictors	19
1.5.2	Futures markets and hedging with futures contracts	20
1.5.3	Inference in the case of stochastic regressors	21
1.6	Bootstrapping in regression	22
1.6.1	The plug-in principle and bootstrap resampling	22
1.6.2	Bootstrapping regression models	24
1.6.3	Bootstrap confidence intervals	25
1.7	Generalized least squares	25

1.8	Implementation and illustration	26
	Exercises	32
2	Multivariate Analysis and Likelihood Inference	37
2.1	Joint distribution of random variables	38
2.1.1	Change of variables	39
2.1.2	Mean and covariance matrix	39
2.2	Principal component analysis (PCA)	41
2.2.1	Basic definitions	41
2.2.2	Properties of principal components	42
2.2.3	An example: PCA of U.S. Treasury-LIBOR swap rates	44
2.3	Multivariate normal distribution	48
2.3.1	Definition and density function	48
2.3.2	Marginal and conditional distributions	50
2.3.3	Orthogonality and independence, with applications to regression	50
2.3.4	Sample covariance matrix and Wishart distribution	52
2.4	Likelihood inference	55
2.4.1	Method of maximum likelihood	55
2.4.2	Asymptotic inference	58
2.4.3	Parametric bootstrap	59
	Exercises	60
3	Basic Investment Models and Their Statistical Analysis	63
3.1	Asset returns	64
3.1.1	Definitions	64
3.1.2	Statistical models for asset prices and returns	66
3.2	Markowitz's portfolio theory	67
3.2.1	Portfolio weights	67
3.2.2	Geometry of efficient sets	68
3.2.3	Computation of efficient portfolios	69
3.2.4	Estimation of α and β and an example	71
3.3	Capital asset pricing model (CAPM)	72
3.3.1	The model	72
3.3.2	Investment implications	77
3.3.3	Estimation and testing	77
3.3.4	Empirical studies of CAPM	79
3.4	Multifactor pricing models	81
3.4.1	Arbitrage pricing theory	81
3.4.2	Factor analysis	82
3.4.3	The PCA approach	85
3.4.4	The Fama-French three-factor model	86

3.5	Applications of resampling to portfolio management	87
3.5.1	Michaud's resampled efficient frontier	87
3.5.2	Bootstrap estimates of performance	88
	Exercises	89
4	Parametric Models and Bayesian Methods	93
4.1	Maximum likelihood and generalized linear models	94
4.1.1	Numerical methods for computing MLE	94
4.1.2	Generalized linear models	95
4.2	Nonlinear regression models.	97
4.2.1	The Gauss'-Newton algorithm	98
4.2.2	Statistical inference	100
4.2.3	Implementation and an example	101
4.3	Bayesian inference	103
4.3.1	Prior and posterior distributions	103
4.3.2	Bayes procedures	104
4.3.3	Bayes estimators of multivariate normal mean and covariance matrix	105
4.3.4	Bayes estimators in Gaussian regression models	107
4.3.5	Empirical Bayes and shrinkage estimators	108
4.4	Investment applications of shrinkage estimators and Bayesian methods	109
4.4.1	Shrinkage estimators of β and Σ for the plug-in efficient frontier	110
4.4.2	An alternative Bayesian approach	111
	Exercises	113
5	Time Series Modeling and Forecasting	113
5.1	Stationary time series analysis	115
5.1.1	Weak stationarity	115
5.1.2	Tests of independence	117
5.1.3	Wold decomposition and MA, AR, and ARMA models	119
5.1.4	Forecasting in ARMA models	121
5.1.5	Parameter estimation and order determination	122
5.2	Analysis of nonstationary time series	123
5.2.1	Detrending	123
5.2.2	An empirical example	124
5.2.3	Transformation and differencing	128
5.2.4	Unit-root nonstationarity and ARIMA models	129
5.3	Linear state-space models and Kalman filtering	130
5.3.1	Recursive formulas for $\mathbf{P}_t, \mathbf{L}_t, \mathbf{X}_t \mathcal{I}_t$	131
5.3.2	Dynamic linear models and time-varying betas in CAPM	133

Exercises	135
6 Dynamic Models of Asset Returns and Their Volatilities ..	139
6.1 Stylized facts on time series of asset returns	140
6.2 Moving average estimators of time-varying volatilities	144
6.3 Conditional heteroskedastic models	146
6.3.1 The ARCH model	146
6.3.2 The GARCH model	147
6.3.3 The integrated GARCH model	152
6.3.4 The exponential GARCH model	152
6.4 The ARMA-GARCH and ARMA-EGARCH models	155
6.4.1 Forecasting future returns and volatilities. . .	156
6.4.2 Implementation and illustration	156
Exercises	157
Part II Advanced Topics in Quantitative Finance	
7 Nonparametric Regression and Substantive-Empirical Modeling	163
7.1 Regression functions and minimum-variance prediction	164
7.2 Univariate predictors	165
7.2.1 Running-mean/running-line smoothers and local polynomial regression	165
7.2.2 Kernel smoothers	166
7.2.3 Regression splines	166
7.2.4 Smoothing cubic splines	169
7.3 Selection of smoothing parameter	170
7.3.1 The bias-variance trade-off	170
7.3.2 Cross-validation	171
7.4 Multivariate predictors	172
7.4.1 Tensor product basis and multivariate adaptive regression splines	172
7.4.2 Additive regression models	173
7.4.3 Projection pursuit regression	174
7.4.4 Neural networks	174
7.5 A modeling approach that combines domain knowledge with nonparametric regression	176
7.5.1 Penalized spline models and estimation of forward rates	177
7.5.2 A semiparametric penalized spline model for the forward rate curve of corporate debt	178
Exercises	179

8	Option Pricing and Market Data	181
8.1	Option prices and pricing theory	182
8.1.1	Options data and put-call parity	182
8.1.2	The Black-Scholes formulas for European options	183
8.1.3	Optimal stopping and American options	187
8.2	Implied volatility	188
8.3	Alternatives to and modifications of the Black-Scholes model and pricing theory	192
8.3.1	The implied volatility function (IVF) model	192
8.3.2	The constant elasticity of variance (CEV) model	192
8.3.3	The stochastic volatility (SV) model	193
8.3.4	Nonparametric methods	194
8.3.5	A combined substantive-empirical approach	195
	Exercises	197
9	Advanced Multivariate and Time Series Methods in Financial Econometrics	... 199
9.1	Canonical correlation analysis	200
9.1.1	Cross-covariance and correlation matrices	200
9.1.2	Canonical correlations	201
9.2	Multivariate regression analysis	203
9.2.1	Least squares estimates in multivariate regression	203
9.2.2	Reduced-rank regression	203
9.3	Modified Cholesky decomposition and high-dimensional covariance matrices	205
9.4	Multivariate time series	206
9.4.1	Stationarity and cross-correlation	206
9.4.2	Dimension reduction via PCA	206
9.4.3	Linear regression with stochastic regressors	207
9.4.4	Unit-root tests	211
9.4.5	Cointegrated VAR	213
9.5	Long-memory models and regime switching/structural change	217
9.5.1	Long memory in integrated models	217
9.5.2	Change-point AR-GARCH models	219
9.5.3	Regime-switching models	224
9.6	Stochastic volatility and multivariate volatility models	225
9.6.1	Stochastic volatility models	225
9.6.2	Multivariate volatility models	228
9.7	Generalized method of moments (GMM)	229
9.7.1	Instrumental variables for linear relationships	229
9.7.2	Generalized moment restrictions and GMM estimation	231

9.7.3	An example: Comparison of different short-term interest rate models	233
Exercises		234
10	Interest Rate Markets	239
10.1	Elements of interest rate markets	240
10.1.1	Bank account (money market account) and short rates	241
10.1.2	Zero-coupon bonds and spot rates	241
10.1.3	Forward rates	244
10.1.4	Swap rates and interest rate swaps	245
10.1.5	Caps, floors, and swaptions	247
10.2	Yield curve estimation	247
10.2.1	Nonparametric regression using spline basis functions	248
10.2.2	Parametric models...	248
10.3	Multivariate time series of bond yields and other interest rates	252
10.4	Stochastic interest rates and short-rate models	255
10.4.1	Vasicek, Cox-Ingersoll-Ross, and Hull-White models	258
10.4.2	Bond option prices	259
10.4.3	Black-Karasinski model	260
10.4.4	Multifactor affine yield models:	261
10.5	Stochastic forward, rate dynamics and pricing of LIBOR and swap rate derivatives	261
10.5.1	Standard market formulas based on Black's model of forward prices	262
10.5.2	Arbitrage-free pricing: martingales and numeraires	263
10.5.3	LIBOR and swap market models	264
10.5A	The HJM models of the instantaneous forward rate	266
10.6	Parameter estimation and model selection	267
10.6.1	Calibrating interest rate models in the financial industry	267
10.6.2	Econometric approach to fitting term-structure models	270
10.6.3	Volatility smiles and a substantive-empirical approach	271
Exercises		272
11	Statistical Trading Strategies	275
11.1	Technical analysis, trading strategies, and data-snooping checks	277
11.1.1	Technical analysis	277
11.1.2	Momentum and contrarian strategies	279

11.1.3 Pairs trading-strategies	279
11.1.4 Empirical testing of the profitability of trading strategies	282
11.1.5 Value investing and knowledge-based trading strategies	285
11.2 High-frequency data, market microstructure, and associated trading strategies	286
11.2.1 Institutional background and stylized facts about transaction data	287
11.2.2 Bid-ask bounce and nonsynchronous trading models	291
11.2.3 Modeling time intervals between trades	292
11.2.4 Inference on underlying price process	297
11.2.5 Real-time trading systems	299
11.3 Transaction costs and dynamic trading	300
11.3.1 Estimation and analysis of transaction costs	300
11.3.2 Heterogeneous trading objectives and strategies	300
11.3.3 Multiperiod trading and dynamic strategies	301
Exercises	302
12 Statistical Methods in Risk Management	305
12.1 Financial risks and measures of market risk	306
12.1.1 Types of financial risks	306
12.1.2 Internal models for capital requirements	307
12.1.3 VaR and other measures of market risk	307
12.2 Statistical models for VaR and ES	309
12.2.1 The Gaussian convention and the λ -modification	309
12.2.2 Applications of PCA and an example	310
12.2.3 Time series models	311
12.2.4 Backtesting VaR models	311
12.3 Measuring risk for nonlinear portfolios	312
12.3.1 Local valuation via Taylor expansions	312
12.3.2 Full valuation via Monte Carlo	314
12.3.3 Multivariate copula functions	314
12.3.4 Variance reduction techniques	316
12.4 Stress testing and extreme value theory	318
12.4.1 Stress testing	318
12.4.2 Extraordinary losses and extreme value theory	318
12.4.3 Scenario analysis and Monte Carlo simulations	321
Exercises	321

Appendix A. Martingale Theory and Central Limit Theorems .	325
Appendix B. Limit Theorems for Stationary Processes	331
Appendix C. Limit Theorems Underlying Unit-Root Tests and Cointegration	333
References	337
