TABLE OF CONTENT	Page
ABSTRACT	V
ACKNOWLEDGEMENT	VI
NOTATION	VII
1. INTRODUCTION	
1.1 General	1.1
1.2 Brief survey of previous work	1.3
1.2.1 Component behaviour	1.3
1.2.2 Non-linear analyses of the framed structures	1.4
1.3 Scope of the present study	1.7
2. BEAM ELEMENT INCLUDING PLASTICITY	2.1
2.1 General	2.1
2.2 Basic formulation of beam element	2.1
2.2.1 Deformation, strain and stress	2.1
2.2.2 Principle of virtual work	2.3
2.3 Elastic beam theory	2.4
2.3.1 Basic assumptions	2.4
2.3.2 Strain-displacement relationship	2.6
2.3.3 Formulation of equilibrium and incremental equilibrium equations	2.6
2.3.4 The incremental form of the equilibrium equations	2.8
2.4 Elasto-plastic beam theory	2.10
2.4.1 Basic assumptions	2.10
2.4.2 Equilibrium and incremental equilibrium equations for an element in an elasto-plastic state	2.11
2.5 Reference frames and transformations	2.14
2.6 Stress computations	2.15

3. MODELLING OF PLASTICITY	3.1
3.1 General	3.1
3.2 Yield criterion	3.3
3.3 Incremental elasto-plastic stiffness matrix	3.7
3.4 Practical yield criterion in the formulation of the system tangential stiffness matrix	3.9
3.5 Plastic membrane elements	3.10
3.5.1 Stiffness matrix for a membrane element	3.13
3.5.2 Unloading criterion for plastic membrane element	3.16
3.5.3 Brief discussion of the membrane element model	3.17
3.6 Comments on the hinge model	3.18
 4. NUMERICAL SOLUTION TECHNIQUE	 4.1
4.1 Solution methods adopted in the analysis	4.1
4.1.1. Euler-Cauchy method	4.1
4.1.2 Equilibrium iteration	4.2
4.1.3 Convergence criterion	4.4
4.2 Control of plasticity	4.5
4.2.1 Increment scaling	4.6
4.2.2 Scaling at the element level	4.7
4.2.3 Unloading check	4.8
4.2.4 Scaling of the "false" transition element	4.10
 5. NON-LINEAR DYNAMIC PLASTIC ANALYSIS	 5.1
5.1 The equations of motion of the structure	5.1
5.2 Structural properties	5.3
5.3 Solution of the incremental equations in dynamic analysis	5.5
5.3.1 Newmark β -family integration	5.5
5.3.2 Equilibrium iterations	5.7
5.4 Solution of the pipe to pipe contact-impact problem	5.10
5.5 Computer program	5.15
 6. NUMERICAL STUDIES	 6.1
6.1 General remarks	6.1

6.2	Static analysis	6.1
6.2.1	Pin-ended beam colum	6.1
6.2.2	K-shaped frames	6.4
6.2.3	Plane frame structure	6.7
6.2.4	Clamped beam	6.10
6.3	Dynamic analyses	6.11
6.3.1	Clamped end beam	6.12
6.3.2	Framed dome	6.19
6.4	Pipe-to-pipe impact	6.22
7.	ANALYSIS OF SHIP/PLATFORM COLLISIONS	7.1
7.1	General	7.1
7.2	Static analyses	7.4
7.3	Dynamic analysis	7.8
7.3.1	Assessment of the peak force and the impact duration	7.8
7.3.2	Dynamic collision analyses	7.12
7.4	Brief summary	7.26
8.	EARTHQUAKE RESPONSE OF JACKET PLATFORMS	8.1
8.1	General	8.1
8.2	Quasi-static analysis	8.7
8.3	Dynamic analysis of a jacket platform subjected to a ground motion	8.11
8.4	Evaluation of the response behaviour of components by structure response spectrum	8.20
9.	CONCLUSIONS AND SUGGESTIONS FOR FURTHER WORK	9.1
10.	REFERENCES	10.1
APPENDIX A	Interpolation functions for the beam element	A.1
APPENDIX B	Submatrices	B.1
APPENDIX C	The incremental element stiffness matrix in elastic plastic state	C.1

APPENDIX D	Submatrice of tangential stiffness matrix for membrane element	D.1
APPENDIX E	Macro Flow Chart of the Program DYSFRA	E.1
APPENDIX F	A well-head jacket platform	F.1
